

Supplementary Figure 1. HPLC profile of anthocyanin compounds detected in the navy and black bean flours. Characterization of bean flour anthocyanins was determined by reversed phase HPLC using an Agilent Technologies 1100 series system with autosampler and quaternary pump, coupled to a DAD and Phenomenex Luna C18 columns ($250 \times 4.6 \mu\text{m}$; $5 \mu\text{m}$) with a C18 guard column (Phenomenex, Torrance, CA). The binary phase consisted of 5% methanol in acetonitrile (v/v) (solvent A) and 5% formic acid in water (v/v) (solvent B). The flow rate was 0.9 ml/min for 70 min (total run time). The gradient program was as follows: 100% B to 90% B in 10 min, 90% B to 85% B in 2 min, 85% B to 76% B in 5 min and maintained at 76% B for 3 min, 76% B to 66% B in 10 min, 66% B to 0% B in 20 min and maintained at 0% B for 10 min. There was a 10 min post-run for reconditioning with 100% B. The injection volume was 10 μL , and peaks were monitored at 520 nm for anthocyanins. All samples were filtered through a 0.45 μm PVDF filter (Waters, USA) before injection. Peaks were identified by congruent retention times and UV spectra with those of the standards. All samples were prepared and analyzed in triplicate.

(a)

Score	Description from H&E stained sections for crypt erosion score	Description from Alcian blue/Nuclear Fast red stained sections for goblet cell depletion score
0	Normal	Normal
1	Dilated crypts with basal immune cell infiltration	Mild goblet cell disorganization
2	Mild crypt distortion with inflammation and submucosal oedema	Increased goblet cell accumulation at the luminal surface
3	Loss of crypt architecture at the basal layer of the crypt and immune cell infiltration	Hyperplastic goblet cells with increased mucin secretion
4	Crypt architecture loss with focal erosions and increased immune cell infiltration	Loss and vacuolization of goblet cells
5	No crypt architecture remaining but luminal epithelial cells are present	Extensive goblet cell depletion
6	No remaining crypt architecture or surface epithelium	Complete goblet cell depletion.

(b)

Supplementary Figure 2. Histological scoring system (a) and histological scores in the proximal, mid, and distal colon from BD, NB, and BB fed mice exposed to DSS (b). a,b, Data are mean values and the SEM are shown. Values not sharing a letter differ, ($P<0.05$) , as measured by Kruskal-Wallis followed by Dunn's multiple comparisons test. BD, basal diet; NB, navy bean; BB, black bean.

Supplementary Table 1. Proximate analyses and dietary fibre levels in bean flour

Nutrients	Navy Bean	Black Bean
	(g/100g DW)	
Fat	2.179	1.724
Protein	23.71	25.71
Available CHO	40.7	42.1
Total Dietary Fibre	24.3	22.3
Ash	3.5	4.4
Moisture	5.6	3.8

Supplementary Table 2. Scoring system for Disease Activity Index (DAI) criteria

Score	% BW loss score	Stool consistency score	Stool blood score
0	0-1%	Normal	Normal (-Hemoccult)
1	1-5%	Soft but formed	+Hemoccult
2	5-10%	Very soft	Visible blood
3	10-20%	Diarrhea	Rectal bleeding

Supplementary Table 3. Pre-DSS body weight (BW) gain and food intake (FI)^{*}

Diet	BW gain (g) [†]		FI (g/day/mouse) [‡]	
	mean	SEM	mean	SEM
BD	3.18	0.3	3.00	0.08
NB	3.48	0.3	3.14	0.07
BB	3.24	0.4	2.98	0.12

BW, body weight; FI, food intake; BD, basal diet; NB, navy bean; BB, black bean.

*Data expressed as means and SEM are shown. BW and FI values did not differ between dietary groups ($P>0.05$).

[†]BW gain was assessed over 14 d of dietary intervention prior to dextran sodium sulfate (DSS) exposure (n=26 for BD, n=13 for NB and BB).

[‡]Average daily FI per mouse was measured on -7, -5, -2, and -1d before the initiation of the 7 d DSS cycle (n=8 for BD, n=4 for NB and BB). Data expressed as means \pm SEM.

Supplementary Table 4. DSS-induced fold changes in colon gene expression (BD+DSS vs BD alone)*

BD, basal diet; DSS, dextran sodium sulfate

*Values shown are fold changes in colon gene expression within the BD+DSS group (n=6) normalized to the expression level of the BD healthy controls (n=4). Genes listed comprise the Mouse Inflammatory Response and Autoimmunity PCR arrays (PAMM-077Z, Qiagen) and mRNA expression of genes listed in bold font differ from healthy controls ($P<0.05$).
