INITIAL is the number of pea aphids released during the early reproductive growth stage; DAY3, DAY10, and DAY17 are number of pea aphids censused from two plants per A-frame three, 10, and 17 days post-infestation; aphid\*DD<sub>2.4°C 3-17</sub> is the cumulative aphid:degree days above 2.4 °C from DAY3 through DAY17; aphid\*DD<sub>2.4°C 0-17</sub> is the cumulative aphid:degree days above 2.4 °C from INITIAL through DAY17.

Relative yield is the total weight of all seeds from each A-frame, standardised to the highest yielding control plot (0 aphids infested).

Relative economic yield is the total weight of #1 grade seeds from each A-frame, standardised to the highest yielding control plot (0 aphids infested).

MSE, mean squared error.

**Supplementary Table 2.** Results of quadratic regression analyses  $y = a + bx + cx^2$  for relationships between dry pea crop yield parameters (y) as a function of pea aphid density (x) during the 2009 and 2010 early reproductive growth stage experiments, Moscow, Idaho.
