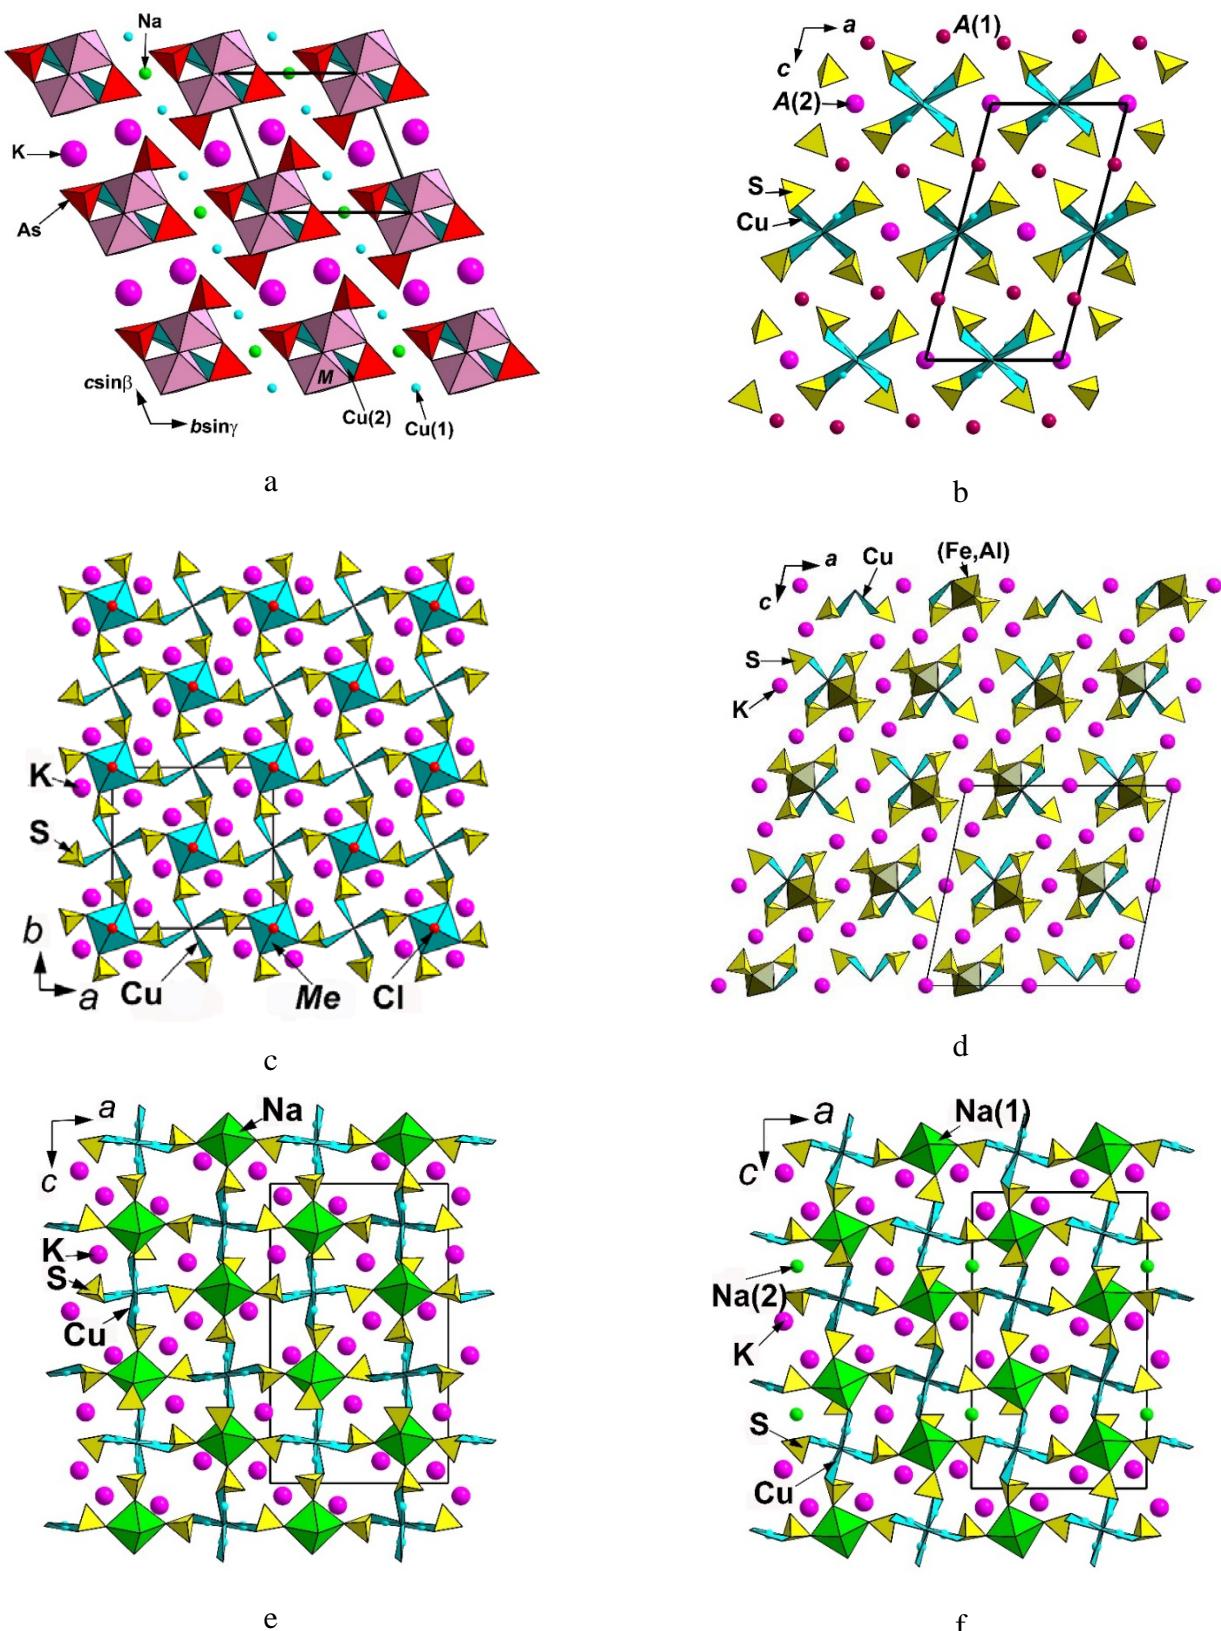

Figure S1. The crystal structures of edtollite/alumoedtollite (our data; for legend see text and Table 6) (a) and structurally related sulfates: eleomelanite (IMA2015-118: our data) (b), piypite (c: drawn using data by Effenberger and Zemann, 1984), klyuchevskite (d: drawn using data by Gorskaya *et al.*, 1992), wulffite (e) and parawulffite (f) (drawn using data by Pekov *et al.*, 2014c). The unit cells are outlined. Cu-centred polyhedra in all structures [except of Cu(1) in edtollite/alumoedtollite] are shown as almost planar squares for better clarity; the *Me* site in piypite can be occupied by K, Na or Cu.
