

Time to adjust: changes in the diet of a reintroduced marsupial after release

HANNAH BANNISTER, ADAM CROXFORD, ROBERT BRANDLE, DAVID C. PATON and KATHERINE MOSEBY

SUPPLEMENTARY FIG. 1 Rainfall and the number of genera available per month during the study period, August 2015–July 2016. The number of annuals available was not significantly related to rainfall in the preceding month, but there was a positive trend.

SUPPLEMENTARY FIG. 2 Selectivity preferences for genera within the possums' diet, averaged across the 12 month study period, where negative values indicate selectivity against a genera and positive values indicate preference; a value of zero suggests consumption at the same rate as availability. Dots represent the mean Jacob's Index value for the genera across the study period. *Value significantly deviates from zero, noting that genera detected in <5% of both scats and vegetation surveys were not tested for statistical significance.

SUPPLEMENTARY TABLE 1 Plant species included in the DNA barcode reference library. Bold text indicates bait (apple, peanut butter and oats).

SUPPLEMENTARY TABLE 4 Jacob's Index values for genera detected in >1 scat, averaged for each month. Genera detected in less than five scats and less than five vegetation surveys were omitted. Positive values indicate a preference relative to availability, negative values indicate avoidance.
