

Supplementary Materials 3: Numerical simulations for trypanocide resistance in the host population for a period of three years. It highlights resistance to: drug(s) 1, 2, and 3, combination of drugs 1 and 2, combination of drugs 1 and 3, and combination of drugs 2 and 3. (A-E) show resistance rates at 4% trypanosomiasis prevalence after treating 10%, 20%, 40%, 80% and 100% of the cattle population respectively. (F-J) show resistance rates at 7.5% trypanosomiasis prevalence after treating 10%, 20%, 40%, 80% and 100% of the cattle population respectively. (K-O) show resistance rates at 11% trypanosomiasis prevalence after treating 10%, 20%, 40%, 80% and 100% of the cattle population respectively.

A

10% treatment with at a constant 0.04 resistance for each drug

B

20% treatment with at a constant 0.04 resistance for each drug

C

40% treatment with at a constant 0.04 resistance for each drug

D

80% treatment with at a constant 0.04 resistance for each drug

E

100% treatment with at a constant 0.04 resistance for each drug

F

10% treatment with at a constant 0.075 resistance for each drug

G

20% treatment with at a constant 0.075 resistance for each drug

H

40% treatment with at a constant 0.075 resistance for each drug

80% treatment with at a constant 0.075 resistance for each drug

J

100% treatment with at a constant 0.075 resistance for each drug

K

10% treatment with at a constant 0.11 resistance for each drug

20% treatment with at a constant 0.11 resistance for each drug

M

40% treatment with at a constant 0.11 resistance for each drug

N

80% treatment with at a constant 0.11 resistance for each drug

O

100% treatment with at a constant 0.11 resistance for each drug
