Notes: N=18,600 observations (n=6,068 respondents); the conditional probability refer to the probability of engaging in a given level of an activity for someone who is classified in a given latent class. For example, someone at age 55 or 56 classified in latent class 3 has a high probability of working full-time (0.71). The totals refer to the number and proportion of individuals classified into each class at each age. hpw: hours per week; PT: part-time; FT: full-time.

Source: BHPS (waves: 6, 8, 10, 12, 14, 16 and 18).

Table A.2 Conditional probabilities for the second stage LCA model, for each pathway

		2nd stage LCA		
LCA stage 1: latent classes by age		Pathway 1, FT to low engagement	Pathway 2, PT work and in- home engagement	Pathway 3, Multiple engagements
Age: 55/56	1	0.06	0.76	0.09
	2	0.00	0.06	0.21
	3	0.07	0.00	0.51
	4	0.87	0.18	0.19

	2	0.92	0.17	0.30
	3	0.00	0.12	0.25
	4	0.05	0.71	0.04
59/60	1	0.03	0.06	0.68
	2	0.08	0.75	0.10
	3	0.89	0.19	0.23
61/62	1	0.06	0.02	0.50
	2	0.00	0.08	0.23
	3	0.10	0.81	0.12
	4	0.83	0.10	0.15
63/64	1	0.03	0.05	0.62
	2	0.84	0.12	0.21
	3	0.13	0.82	0.17
65/66	1	0.17	0.79	0.10
	2	0.05	0.07	0.72
	3	0.79	0.14	0.19
67/68	1	0.14	0.78	0.11
	2	0.07	0.06	0.75
	3	0.79	0.16	0.14
69/70	1	0.03	0.03	0.42
	2	0.32	0.85	0.35
	3	0.05	0.00	0.12
	4	0.61	0.13	0.11

Notes: N=6068; the conditional probability refer to the probability of being classified in a given latent class in the first stage for someone who is classified in a given pathway. The conditional probabilities in tables A.1a and A.1b can be combined with the expected probabilities in this table to produce the figure 2 graphs. For example, to calculate the expected probability of working full-time at age 55-56 for the *FT to low engagement* pathway:

$0.66 \approx (0.06*0.20) + (0*0.07) + (0.07*0.71) + (0.87*0.69)$. ; PT: part-time; FT: full-time.
