

Tab. S1. Results of ANOVA from the linear mixed effects model analysis to show the effects of forest type, habitat type and sampling depth on soil physicochemical properties (gravimetric water content, organic matter, bulk density, pH and nutrient concentrations; total N, P, K, Ca and Mg). Significant P-values are highlighted in bold. Sampling depth was not included in the LME of bulk density as bulk density was only sampled at topsoil depth (0 – 15 cm).
