

Appendix S2

Detailed results from species distribution models.

Considering test data for models with climatic or geographic variables, respectively, three and one species (1.7 and 0.6%) had AUC values lower than 0.5, while 52 and 68 species (29.2 and 38.2%) had AUC values lower than 0.7 (Table S2.1).

Comparing taxonomic groups, for models with climatic or geographic variables respectively, only three and one arthropods species (4.5 and 1.5%) had AUC values lower than 0.5 (for models considering climatic variables – *Crotchiella brachyptera*, *Drouetius borgesii centralis*, *Megaselia leptofemur* – and geographic variables – *Orchestia chevreauxi* – respectively). For climatic predictors, the highest number of AUC values lower than 0.7 was in arthropod species (19 species – 28.8%) while for geographic predictors it was in vascular plants (26 species, 53.1%).

Table S2.1 Number of species with AUC values lower than 0.7 and/or lower than 0.5 (values in brackets are the corresponding percentages).

	Test Data				
	n total	Climatic predictors		Geographic predictors	
		n AUC < 0.5	n AUC < 0.7	n AUC < 0.5	n AUC < 0.7
Bryophytes	50	0 (0.0%)	15 (30.0%)	0 (0.0%)	14 (28.0%)
Vascular plants	49	0 (0.0%)	15 (30.6%)	0 (0.0%)	26 (53.1%)
Molluscs	13	0 (0.0%)	3 (23.1%)	0 (0.0%)	8 (61.5%)
Arthropods	66	3 (4.5%)	19 (28.8%)	1 (1.5%)	20 (30.3%)
Total	178	3 (1.7%)	52 (29.2%)	1 (0.6%)	68 (38.2%)

Table S2.2 Species included in the SDMs analyses, number of samples (n) of each data set used for modelling, AUC values of training (Tr) and test (Te) data, and selection or rejection of species for subsequent analysis (see section 2.3 for details). AUC values lower than 0.5 and/or 0.7 are shaded in gray; AzE: Azorean endemism; CS: conservation status (bryophytes conservation status was based on the Azorean Biodiversity Portal – <http://www.azoresbiportal.angra.uac.pt/>).
