

A Appendix

Figure A.1 shows an example of dependence among three of the selected variables. Figure A.1 depicts the vehicle types in relation to their values and ages. It is possible to notice that *vehicle value* and *vehicle body* are dependent (clearly, the type of vehicle influences their price), while *vehicle value* and *vehicle age* present a negative dependence (older vehicles have in general lower value, as indicated by the yellow dots in the bottom of the graph). For what concerns the other risk factors, we observed weak forms of dependence (not shown here).

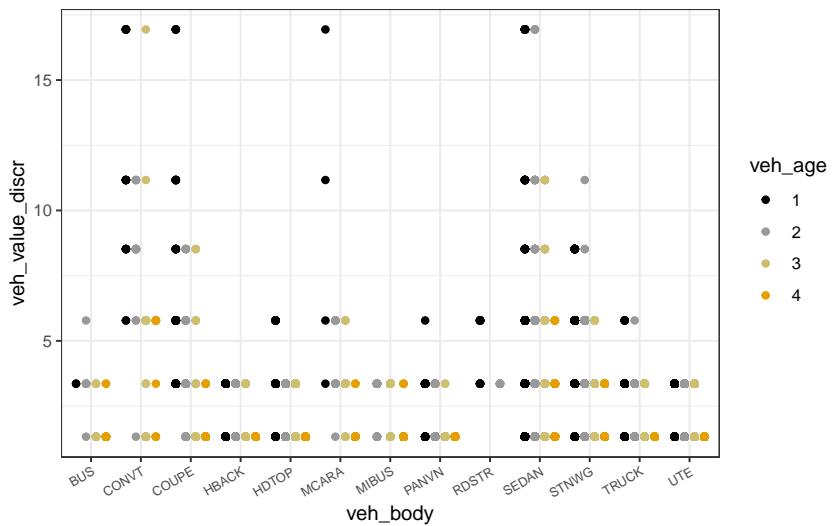

Figure A.1: Discretised vehicle value (in tranches of \$10000) with respect to its type and age. Different colours of the bullets represent the various ages, going from the youngest (1) to the oldest (4).

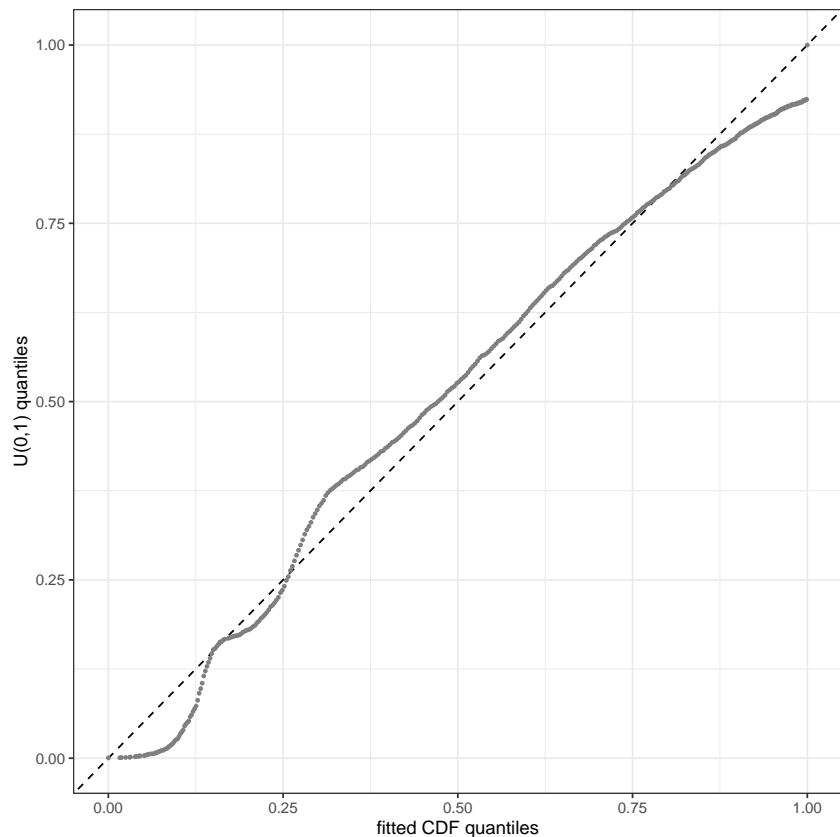

Figure A.2: QQ plot of the quantiles of a standard Uniform distribution and the predicted quantiles of the parametric quantile regression model. This comparison has been proposed by Frumento and Bottai (2016). The alignment is acceptable.

Table A.1: Parameters estimates obtained with the Logit GLM.
