

Supplemental Figure 4. Stability Plot of the Centrality Order

**A. Acute Population**

**B. PNS Population**

(A) Acute population, (B) Predominant negative symptom (PNS) population.

Decreasing portions of the patient population were sampled, and the average correlations (with 95% confidence interval) are presented. Note that the network for the PNS population was less stable, which may be due to its smaller sample size; however, after reducing the sample size to 50%, the average correlation with the results of the full population is preserved at a level of at least 0.75. This is an indication of the robustness of the network estimation.
