

## **Supplementary material 2**

This is part 2 of the supplementary material for the article entitled “Direct and Indirect Associations Between Childhood Adversity and Emotional and Behavioural problems at Age 14: a Network Analytical Approach”. The supplement provides information regarding the following topics: 1) results of the network stability analysis. These supplementary materials contains two figures. Figure 1 contains the 95% bootstrapped confidence intervals for all potential edges in the main network model presented in the manuscript. Figure 2 contains information regarding the number of times an edge was excluded (i.e., had a value of zero) across the bootstrapped networks. A value of 0.0 indicates that an edge was included in all bootstrapped networks, whereas a value of 1.0 indicates that an edge was not included in any of the bootstrapped networks.
