

Supplementary material for the paper “Seed ecology of post-fire flowering species from the Cerrado” published on Seed Science Research

Fontenele & Miranda 2022

**Supplementary material 1.** Maximum and minimum air temperature and relative humidity (RH) of the storage cabinet and the germination room. Dark bars show the mean of the observations.

**Supplementary material 2.** Ash content after fire. Right after fire, the area had a mean amount of  $114 \text{ g m}^{-2}$  ( $1,2 \text{ Mg h}^{-1}$ ) of ash, which remained stable through the first weeks after fire but reduced by the second month.

**Supplementary material 3.** Excel spreadsheet detailing the results from GLMs.
