Appendix S2: linear mixed effects model outputs referenced in main paper

In all models significance values are estimated by the R package lmerTest (version 2.0-11; Kuznetsova, Brockhoff & Christensen, 2014):

*** p<.001, ** p<.01, * p<.05, ⁺ p<.10. For likelihood of skipping a logistic linear mixed effects model was used and for fixation count a generalised linear model with poisson regression was used. For all duration measures linear mixed effects models were used and only non-skipped items were included.
