

Supplementary material for

Theoretical inversion of fossil hydrothermal systems with oxygen isotopes of constituent minerals partially re-equilibrated with externally infiltrated fluids

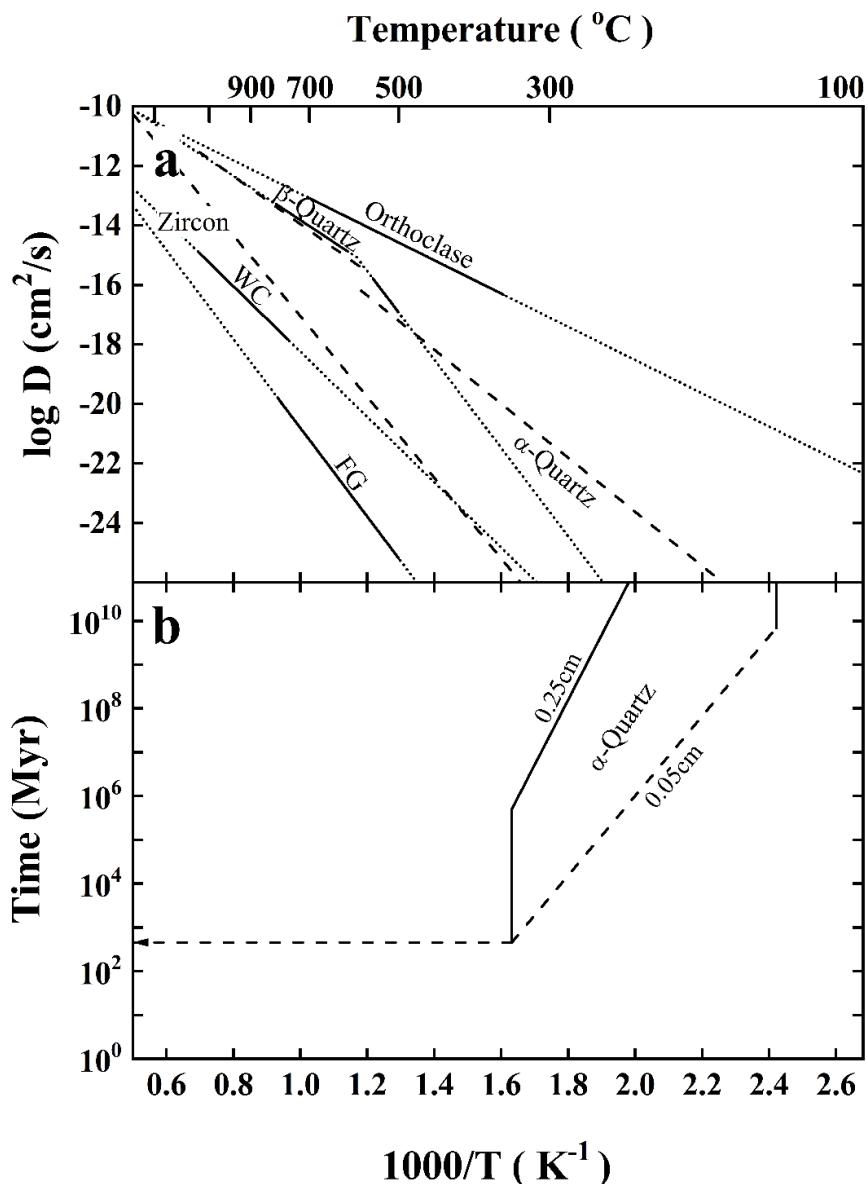

Chun-Sheng WEI* and Zi-Fu ZHAO

CAS Key Laboratory of Crust-Mantle Materials and Environments, School of Earth and Space Sciences, University of Science and Technology of China, Hefei 230026, China.

supplementary Figure 1 The external infiltration of magmatic water with gneissic country rock (sample 01Tzs05) intruded by the Tianzhushan granitoid pluton granitoid. The observed and initial $\delta^{18}\text{O}$ values refer to supplementary Tables 1 and 2, respectively.

supplementary Figure 2 (a) Arrhenius plot of oxygen diffusion in minerals under wet conditions. Dashed lines are theoretical calculations (Zheng & Fu 1998), dotted lines with solid segments are experimentally determined. For zircon, WC is from Watson & Cherniak (1997) and FG is from Fortier & Giletti (1989), respectively. Quartz data are from Giletti & Yund (1984), and orthoclase is after Giletti *et al.* (1978). (b) Oxygen diffusive modelling for quartz with two radii (solid line based on experimentally determined parameters, whereas dashed line based on theoretical ones). Model of a spherical crystal is adopted, and arrowed line denotes the timescale required for quartz of sample 01Tzs05 to diffuse oxygen with an externally infiltrated magmatic water.

supplementary Table 1 Oxygen isotopes of granitoids and gneisses from the Dabie orogen in central-eastern China¹
