

# Sivaram Cheruvu

## Education, Public Support for Institutions, and the Separation of Powers

### Appendices

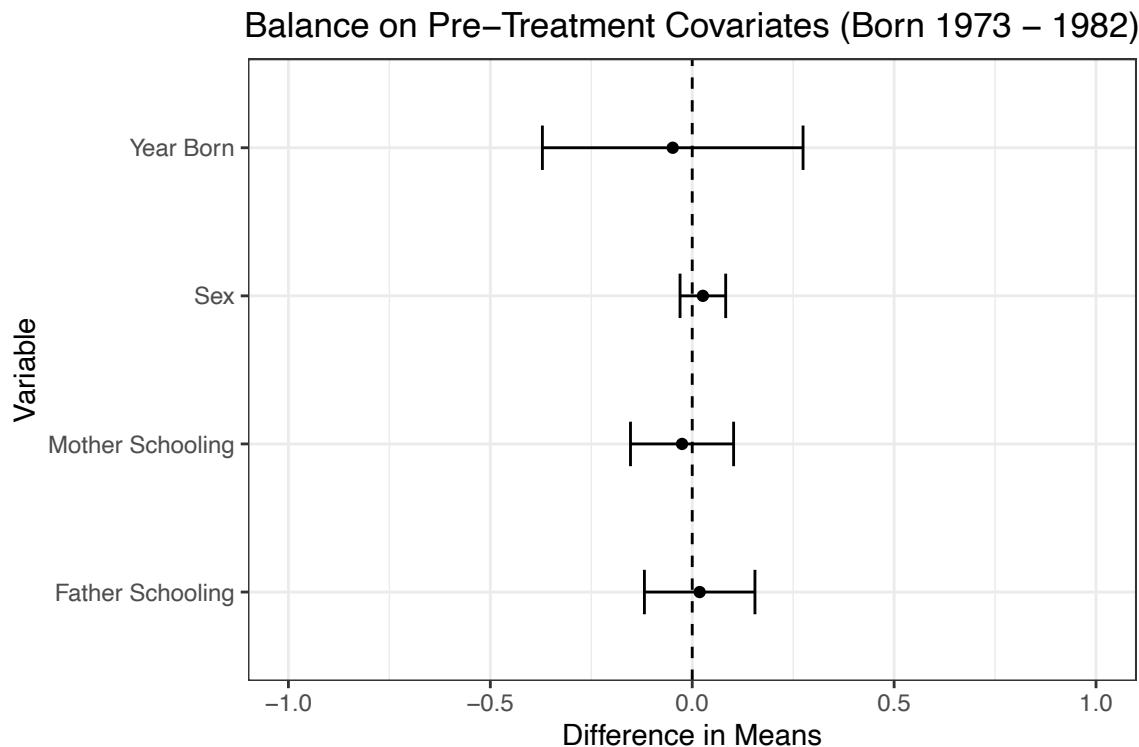

Figure A1: This figure plots the covariate balance among the treatment (born June 1st or later among the affected cohorts) and control groups (born before June 1). The black dots indicate the difference in means among covariates and the error bars represent 95% confidence intervals. Statistically significant differences do not exist between the treatment and control groups.

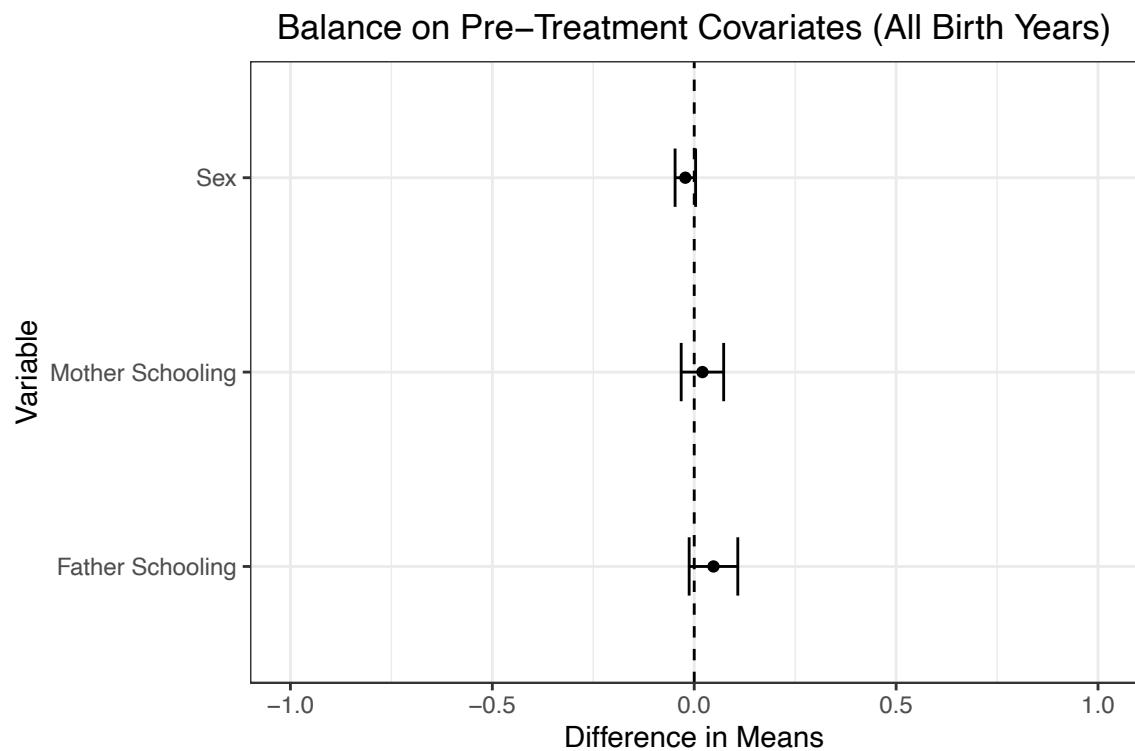

Figure A2: This figure plots the covariate balance among the treatment (born June 1st or later) and control groups (born before June 1) for all data used in the difference-in-difference-in-differences models. The black dots indicate the difference in means among covariates and the error bars represent 95% confidence intervals. Statistically significant differences do not exist between the treatment and control groups.

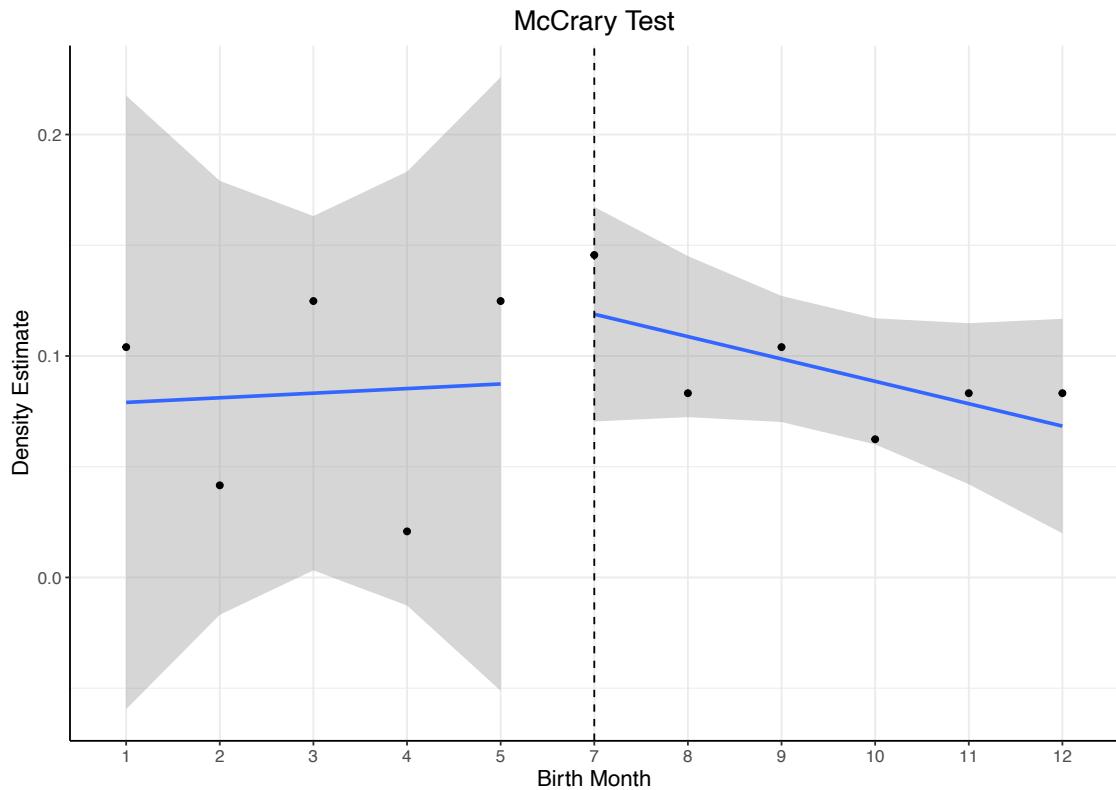

Figure A3: This figure shows a McCrary Test for the running variable (birth month) using the `rdd` package in R. The confidence intervals overlap substantially, casting doubt on any potential sorting around the cutoff.

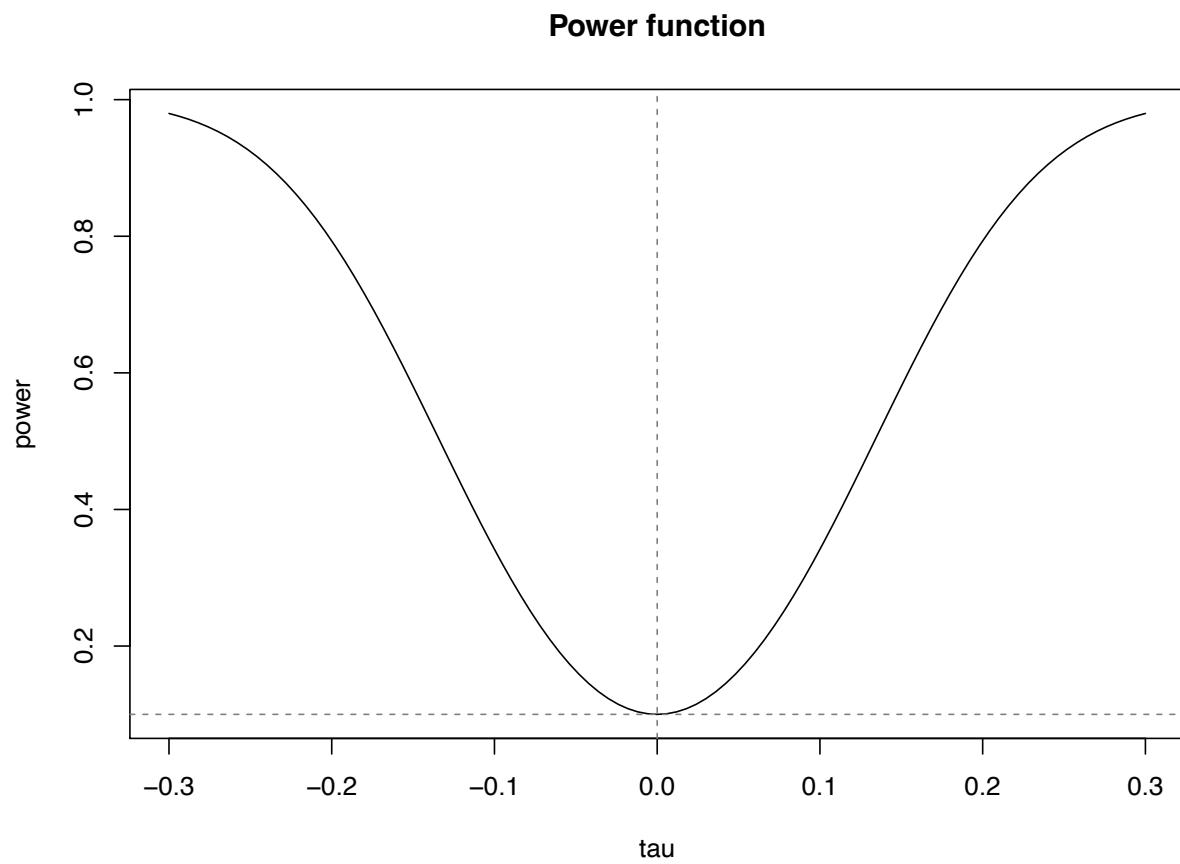

Figure A4: This figure plots the power test as suggested by [Cattaneo, Titiunik and Vazquez-Bare \(2019\)](#). As demonstrated by the plot, it would require an effect size of .2 or a full standard deviation to observe an effect.

# Survey Year Regression Discontinuity Models

Table A1: Pooled RD Models

	<i>Dependent variable:</i>			
	Trust FCC	Trust Parliament	Trust Federal	Financial Situation
	(1)	(2)	(3)	(4)
